

OVERVIEW

When you first hear the term information assurance you tend to conjure up an image of a balanced set of reasonable measures that have been taken to protect the information after an assessment has been made of risks that are posed to it.

Information assurance is a term that has recently come into common use.

Information assurance is ensuring that your information is where you want it, when you want it, in the condition that you need it and available to those that you want to have access to it – but only to them.

OBJECTIVES

- To bridge the gap between IA as a technical concept and as a business concept. Thus, allowing information system managers to effectively manage information systems' security in a manner so as to facilitate the business process and contribute to the competitive advantage of the organization.
- To provide information systems managers and students with a core text on assuring accurate information is available when needed to only those that need it. As the Internet continues to expand and more companies start conducting business on the Internet, e-business, there is going to be a need for people who understand not only the IA concepts and best practices, but also the business, legal and technical aspects of conducting business online.

AUDIENCE

IT managers. IT Security Managers, IT auditors, and anyone interested in the domain of Information Security.
